In the shift towards a low carbon built environment, new technologies, digital processes, fabrication and efficient assembly methods are transforming the way buildings are designed, built and operated. The "internet of everything" – IoT, Big Data and more – is connecting people, systems, buildings and communities in ways that will disrupt traditional policies, workflows and relationships. As the procurement, production and operation of buildings and cities moves from analogue to digital, project teams will need to collaborate fully and effectively.

Join us in Vancouver to learn more about new methods, technologies and relationships that will impact how we deliver smart, climate-friendly buildings and cities in the future.
